Glossary:At-risk-ofpoverty rate

Statistics Explained

The **at-risk-of-poverty rate** is the share of people with an equivalised disposable income (after social transfer) below the **at-risk-of-poverty threshold**, which is set at 60 % of the national median equivalised disposable income after social transfers.

This indicator does not measure wealth or poverty, but low income in comparison to other residents in that country, which does not necessarily imply a low standard of living.

The **at-risk-of-poverty rate before social transfers** is calculated as the share of people having an equivalised disposable income before social transfers that is below the at-risk-of-poverty threshold calculated after social transfers. Pensions, such as old-age and survivors' (widows' and widowers') benefits, are counted as income (before social transfers) and not as social transfers. This indicator examines the hypothetical non-existence of social transfers.

The **persistent at-risk-of-poverty rate** shows the percentage of the population living in households where the equivalised disposable income was below the at-risk-of-poverty threshold for the current year and at least two out of the preceding three years. Its calculation requires a longitudinal instrument, through which the individuals are followed over four years.
